

Descriptors for genetic markers technologies

Version 1.0, February 2004

Carmen De Vicente, Thomas Metz
and Adriana Alercia

FUTURE
HARVEST
<www.futureharvest.org>

IPGRI is
a Future Harvest Centre
supported by the
Consultative Group on
International Agricultural
Research (CGIAR)

The International Plant Genetic Resources Institute (IPGRI) is an independent international scientific organization that seeks to advance the conservation and use of plant genetic diversity for the well-being of present and future generations. It is one of 16 Future Harvest Centres supported by the Consultative Group on International Agricultural Research (CGIAR), an association of public and private members who support efforts to mobilize cutting-edge science to reduce hunger and poverty, improve human nutrition and health, and protect the environment. IPGRI has its headquarters in Maccarese, near Rome, Italy, with offices in more than 20 other countries worldwide. The Institute operates through three programmes: (1) the Plant Genetic Resources Programme, (2) the CGIAR Genetic Resources Support Programme and (3) the International Network for the Improvement of Banana and Plantain (INIBAP).

The international status of IPGRI is conferred under an Establishment Agreement which, by January 2003, had been signed by the Governments of Algeria, Australia, Belgium, Benin, Bolivia, Brazil, Burkina Faso, Cameroon, Chile, China, Congo, Costa Rica, Côte d'Ivoire, Cyprus, Czech Republic, Denmark, Ecuador, Egypt, Greece, Guinea, Hungary, India, Indonesia, Iran, Israel, Italy, Jordan, Kenya, Malaysia, Mauritania, Morocco, Norway, Pakistan, Panama, Peru, Poland, Portugal, Romania, Russia, Senegal, Slovakia, Sudan, Switzerland, Syria, Tunisia, Turkey, Uganda and Ukraine.

Financial support for IPGRI's research is provided by more than 150 donors, including governments, private foundations and international organizations. For details of donors and research activities please see IPGRI's Annual Reports, which are available in printed form on request from ipgri-publications@cgiar.org or from IPGRI's Web site (www.ipgri.cgiar.org).

The geographical designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of IPGRI or the CGIAR concerning the legal status of any country, territory, city or area or its authorities, or concerning the delimitation of its frontiers or boundaries. Similarly, the views expressed are those of the authors and do not necessarily reflect the views of these organizations.

Mention of a proprietary name does not constitute endorsement of the product and is given only for information.

Introduction

This List of ***Descriptors for Genetic Markers Technologies*** was originally developed by Dr Carmen de Vicente, Dr Thomas Metz and Ms Adriana Alercia in an effort attempt to define community standards for documenting information about genetic markers. This document is targeted to researchers using genetic marker technologies to generate and exchange genetic marker data that are standardized and replicable.

This initial proposed set of descriptors was reviewed widely by international experts from national research institutions, universities and CGIAR centres, and their comments and contributions were included through several iterations of the document. This first official version of the list is now being published by IPGRI to encourage application of the descriptors to current research projects and to stimulate further refinement of the standards.

This List of Descriptors defines an initial minimum set of information that is needed to describe a genetic marker technology. This List provides descriptions of content, and coding schemes that can assist in the computerized data exchange. It is realized that users may want to implement modifications and/or additions to meet specific needs. As long as these modifications allow for an easy conversion to the format proposed below, this type of data can be exchanged worldwide in a consistent manner.

It is anticipated that future refinements of the standards may evolve towards documentation comparable to the MIAME standards for microarray experiments and associated encoding formats (i.e. the XML-based MAGE-ML implementation of MIAME).¹ Future versions may also incorporate refinements based on the methodology of biological ontology research community,² for example, assignment of a term accession identifier to each descriptor definition, and placement of the terms into a structured ontology.

The standardization of such information should facilitate the development of data exchange encoding formats (i.e. an XML DTD) for information on markers and the creation of a global registry containing a full and accurate inventory of species-specific reference markers already published.

Special thanks are due to Dr Richard Bruskiwich of IRRI for the comprehensive advice given during the revision process.

Comments and suggestions are welcome and should be addressed to: Adriana Alercia <a.alercia@cgiar.org>.

²Gene Ontology Consortium, 2000

1. Marker identifiers and names

► **Universal marker identifier**

It is proposed that marker systems be registered with the global community of genetic mapping databases and be assigned a permanent ***Universal marker identifier*** (UMI), an accession identifier similar in concept to international public sequence database (Genbank/EMBL/DDBJ) accession identifiers. The UMI will serve as a unique identifier of a marker system and should never be re-assigned

► **Canonical marker name**

Record the canonical name as the first published or most authoritative name of the marker insofar possible.

Below are presented two options to generate new canonical marker names:

(i) A marker could be given a descriptive canonical marker name based upon standard protocols specific to a particular class of marker: RFLP, AFLP, etc. Letters could be used to identify either: a DNA library, a series of a commercial kit, primer sequences, or the selective bases and enzyme combination.

(ii) Alternatively, the canonical marker name could consist of the following: [Function][Lab Designator][Species][Type of marker][serial # of clone] e.g. Xipam001 A marker of unknown function (X), developed by ICRISAT-Patancheru (ip) for Arachis (a), and a microsatellite marker (m), followed by serial # of clone Where different marker types could be identified as follows: microsatellite =m, aflp=a, rapd=r, rflp=f, snp=s, scars=c, sts=t, est=e

When more than one genetic locus is identified by a particular marker, then it should be followed by a full stop and a (single-digit) serial number indicating the order in which they were identified: e.g., Xipam001.1 and Xipam001.2

► **Accession number**

(i.e. Genebank, Herbarium, University)

2. Taxonomy

Where feasible, the NCBI taxonomy <http://www.ncbi.nlm.nih.gov/Taxonomy/> accession identifier will be used to specify the species or general taxon of organism targeted by the marker system and full taxonomic details of the target species should be recorded as stated below.

Strains, cultivars or subspecies should also be qualified by their SINGER or comparable germplasm accession identifier

► Genus

Genus name for taxon. Initial uppercase letter required.

► Species

Specific epithet portion of the scientific name in lowercase letters. Following abbreviation is allowed: 'sp.' for undetermined species or generic group of samples from the same genus

★ Species authority

Provide the species authority

► Subtaxa

Any additional taxonomic identifier. The following abbreviations are allowed: 'subsp.' (for subspecies); 'convar.' (for convariety); 'var.' (for variety); 'f.' (for form).

★ Subtaxa authority

Provide the subtaxa authority

3. Markers nature and types

➤ Protein-based markers

Isozymes

Seed storage proteins

Total soluble proteins

➤ Metabolic based markers

Polyphenol profile

Flavonoids

Carbohydrates

Oils

Secondary products

➤ DNA-based markers

Hybridization based

RFLP

Polymerase chain reaction-based

RAPD

SSR, STR, STMS or microsatellite

AFLP

CAPS

EST

Inter-SSR

SNPs

SCAR

PCR-sequencing

Other (specify in descriptor **7. Remarks**)

➤ Phenotype based markers

4. Experimental conditions

Provide information on reliable and proven protocols (that is laboratory recipes for extraction, generation of markers and interpretation) with references, as appropriate

► Protein based markers

4.1 Isozymes

★ **Canonical marker name**

In the case of isozymes, the marker identifier should refer to the International codes for Enzyme Nomenclature (IUBMB). For example, PGM (phosphoglucomutase)

★ **Sample extraction method**

Indicate the tissue and the recipe for the extraction buffer used

★ **Marker sample separation**

◆ **Electrophoresis**

- ***Gel composition***
- ***Buffer composition***
- ***Running conditions***

- Voltage
- Current
- Time of run

- ***Other methods of separation***

Specify in descriptor **7. Remarks**

★ **Identification process**

◆ **Staining**

Indicate the recipe for the staining solutions and conditions for incubation

◆ **Other staining solutions**

Specify in descriptor **7. Remarks**

4.2 Seed storage proteins

4.3 Total soluble proteins

► DNA-based markers

4.4 RFLP

★ **Canonical marker name**

See instructions under ***Section 1***.

★ **DNA extraction method**

Indicate the protocol used or/the reference where the protocol was published

Total

Chloroplastic

Mitochondrial

★ **DNA probe and origin**

Indicate the name of the probe, if used, and the Laboratory, which obtained it

★ **Genome location**

Nuclear

Chloroplastic

Mitochondrial

★ **Restriction enzyme**

Indicate the restriction enzyme used to digest the DNA

★ **Electrophoresis**

◆ **Gel composition**

◆ Running conditions

- Voltage
- Current
- Time of run

★ Visualization

Indicate experimental procedures for detection of markers

◆ Radioactive

Enumerate radioisotopes and their activities

P³³

P³²

S³⁵

Other (specify in descriptor **7. Remarks**)

◆ Non-radioactive

Fluorescence

Chemiluminescence

Other (specify in descriptor **7. Remarks**)

4.5 RAPD³**★ Canonical marker name**

See instructions in **Section 1**.

★ DNA extraction method

Indicate the protocol used or/the reference where the protocol was published

★ Primer sequence

List primer sequence and commercial provider

³Be aware that this technology is not highly reproducible.

★ **PCR reaction (composition)**

Specify MgCl_2 and/or primer concentrations and any other reagent, in addition to standard components

★ **PCR conditions**

◆ **Thermocycler**

Indicate the brand name and model

◆ **Initial denaturation**

- Temperature [°C]
- Duration [s]

◆ **Amplification conditions**

• ***Number of cycles***

• ***Denaturation***

- Temperature [°C]
- Duration [s]

• ***Annealing***

- Temperature [°C]
- Duration [s]

• ***Elongation***

- Temperature [°C]
- Duration [s]

◆ **Terminal elongation**

- Temperature [°C]
- Duration [s]

★ **Electrophoresis**

◆ **Gel composition**

◆ Running conditions

- Voltage
- Current
- Time of run

★ Visualization

Indicate experimental procedures for detection of markers.

◆ Detection

Ethidium bromide

Other (specify in descriptor **7. Remarks**)

4.6 Microsatellites**★ Canonical marker name**

See instructions under **Section 1**.

★ Publication of primers

Provide original reference

★ DNA extraction method

Indicate the protocol used or/the reference where the protocol was published

★ Primer sequences

List primer sequences

★ Genomic location

Nuclear

Chloroplastic

Mitochondrial

★ Primers' origin

Indicate the Research Laboratory which designed them

★ **PCR reaction (composition)**

Specify MgCl_2 and/or primer concentrations and any other important reagent, in addition to standard components

★ **PCR conditions**

◆ **Initial denaturation**

- Temperature [°C]
- Duration [s]

◆ **Touchdown amplification conditions**

Touchdown amplification conditions (only if using touchdown program)

- ***Number of cycles***
- ***Denaturation***
 - Temperature [°C]
 - Duration [s]
- ***Annealing***
 - Starting temperature [°C]
 - ΔT [°C]
 - Duration [s]
- ***Elongation***
 - Temperature [°C]
 - Duration [s]

◆ **Amplification conditions**

- ***Number of cycles***
- ***Denaturation***
 - Temperature [°C]
 - Duration [s]

- **Annealing**
 - Temperature [°C]
 - Duration [s]

- **Elongation**
 - Temperature [°C]
 - Duration [s]

- ◆ **Terminal elongation**
 - Temperature [°C]
 - Duration [s]

★ **Electrophoresis**

- ◆ **Gel composition**

- ◆ **Running conditions**
 - Voltage
 - Current
 - Time of run

★ **Visualization**

Indicate experimental procedures to visualize the markers

- ◆ **Radioactive**
 - P³³
 - P³²
 - S³⁵
 - Other (specify in descriptor **7. Remarks**)

- ◆ **Non-radioactive**
 - Ethidium bromide
 - Silver staining
 - Fluorescence
 - Other (specify in descriptor **7. Remarks**)

4.7 AFLP

★ **Canonical marker name**

See instructions under **Section 1**.

★ **DNA extraction method**

Indicate the protocol used or/the reference where the protocol was published

★ **Enzyme combinations**

Indicate the restriction enzymes used to digest the DNA

★ **Adaptors**

Indicate adaptors for the restriction sites

★ **Primer sequences**

List primer sequences

★ **PCR reaction (composition)**

Specify MgCl_2 and/or primer concentrations and any other important reagent for both amplifications in addition to standard components

Pre-selective

Selective

★ **PCR conditions**

◆ **Pre-selective**

- **Initial denaturation**
 - Temperature [°C]
 - Duration [s]

- ***Amplification conditions***
 - ***Number of cycles***
 - ***Denaturation***
 - Temperature [°C]
 - Duration [s]
 - ***Annealing***
 - Temperature [°C]
 - Duration [s]
 - ***Elongation***
 - Temperature [°C]
 - Duration [s]

- ***Terminal elongation***
 - Temperature [°C]
 - Duration [s]

◆ **Selective**

- ***Initial denaturation***
 - Temperature [°C]
 - Duration [s]

- ***Amplification conditions***
 - ***Number of cycles***
 - ***Denaturation***
 - Temperature [°C]
 - Duration [s]
 - ***Annealing***
 - Temperature [°C]
 - Duration [s]
 - ***Elongation***
 - Temperature [°C]
 - Duration [s]

- ***Terminal elongation***

- Temperature [°C]
- Duration [s]

- ★ **Electrophoresis**

- ◆ **Gel composition**

- ◆ **Buffer composition**

- ◆ **Running conditions**

- Voltage
- Current
- Time of run

- ★ **Visualization**

Indicate experimental procedures to visualize the markers

- ◆ **Radioactive**

Enumerate radioisotopes and their activities

P³³

P³²

S³⁵

Other (specify in descriptor **7. Remarks**)

- ◆ **Non-radioactive**

Silver staining

Fluorescence

Other (specify in descriptor **7. Remarks**)

4.8 CAPS

- ★ **Canonical marker name**

See instructions under Section **1**.

★ **DNA extraction method**

Indicate the protocol used, or the reference where the protocol was published

★ **Primer sequence**

List primer sequences

★ **Genome location**

Nuclear

Chloroplastic

Mitochondrial

★ **PCR conditions**

◆ **Thermocycler**

Indicate the brand name and model

◆ **Initial denaturation**

- Temperature [°C]
- Duration [s]

◆ **Amplification conditions**

- ***Number of cycles***
- ***Denaturation***
 - Temperature [°C]
 - Duration [s]
- ***Annealing***
 - Temperature [°C]
 - Duration [s]
- ***Elongation***
 - Temperature [°C]
 - Duration [s]

★ **Restriction enzyme**

Indicate the restriction enzyme used to digest the amplified DNA fragment

★ **Electrophoresis**

◆ **Gel composition**

◆ **Running conditions**

- Voltage
- Current
- Time of run

★ **Visualization**

Indicate experimental procedures to visualize the markers

◆ **Detection**

Ethidium bromide

Silver staining

Other (specify in descriptor **7. Remarks**)

5. Interpretation of markers

➤ Genotypes used as reference standards

List genotypes used as reference standards

➤ Protein based markers

★ Isozymes

◆ Genetic control of the isoenzymatic system

(Number of genes)

◆ Number of alleles per gene

◆ Molecular structure of the isozyme

Monomeric

Dimeric

Other (specify in descriptor **7. Remarks**)

★ Seed storage proteins

★ Total soluble proteins

➤ Metabolic based markers

➤ DNA based markers

★ Fragment size-marker used

Indicate the fragment size-marker used (i.e. Lambda)

★ Predicted product length

Indicate the range length in which the marker may provide informative bands

✱ **Number of bands or alleles obtained**

Report the number of unique bands or alleles obtained for the genotypes used as reference standards

✱ **Dominance**

Indicate if the marker is co-dominant or dominant

Dominant

Co-dominant

➤ **Phenotype based markers**

6. Use of the results

Indicate in which aspects the specific marker can be used:

Fingerprinting (e.g. identification of duplicates)

Measure of diversity and/or genetic distance

Taxonomic classification

Identification of abiotic and biotic stresses susceptibilities

Map location

Linking markers with traits

Measure of the mating patterns (out crossing rate and gene flow)

Other (specify in descriptor **7. Remarks**)

7. Remarks

The remarks field is used to add notes or to elaborate on descriptors listed as 'Other. Prefix remarks with the field name they refer to and a colon. Separate remarks referring to different fields are separated by semicolons without space.
